Who Am I

Suwicha Saeling
DSI STUDENT
Son of Rubber Shop

Junior Data Scientist at
Rubber cooperative

Part 1: Problem Statement

Why I chose Rubber

**Households
2.9M**

**Rubber Plantation
owners
1M**

**Facing Rubber
Price Fluctuations**

Why I chose Rubber

The Rubber price fluctuated due to various world events such as:

1. Downward trending demand for medical gloves decreased during the pandemic.
2. Semiconductor chips in short supply which dramatically curtailed production in the auto industry. ([source](#))

Rubber Cooperative Cycle

The **problem** in Rubber cooperative is using **Instinct-Decision** based from the experience.

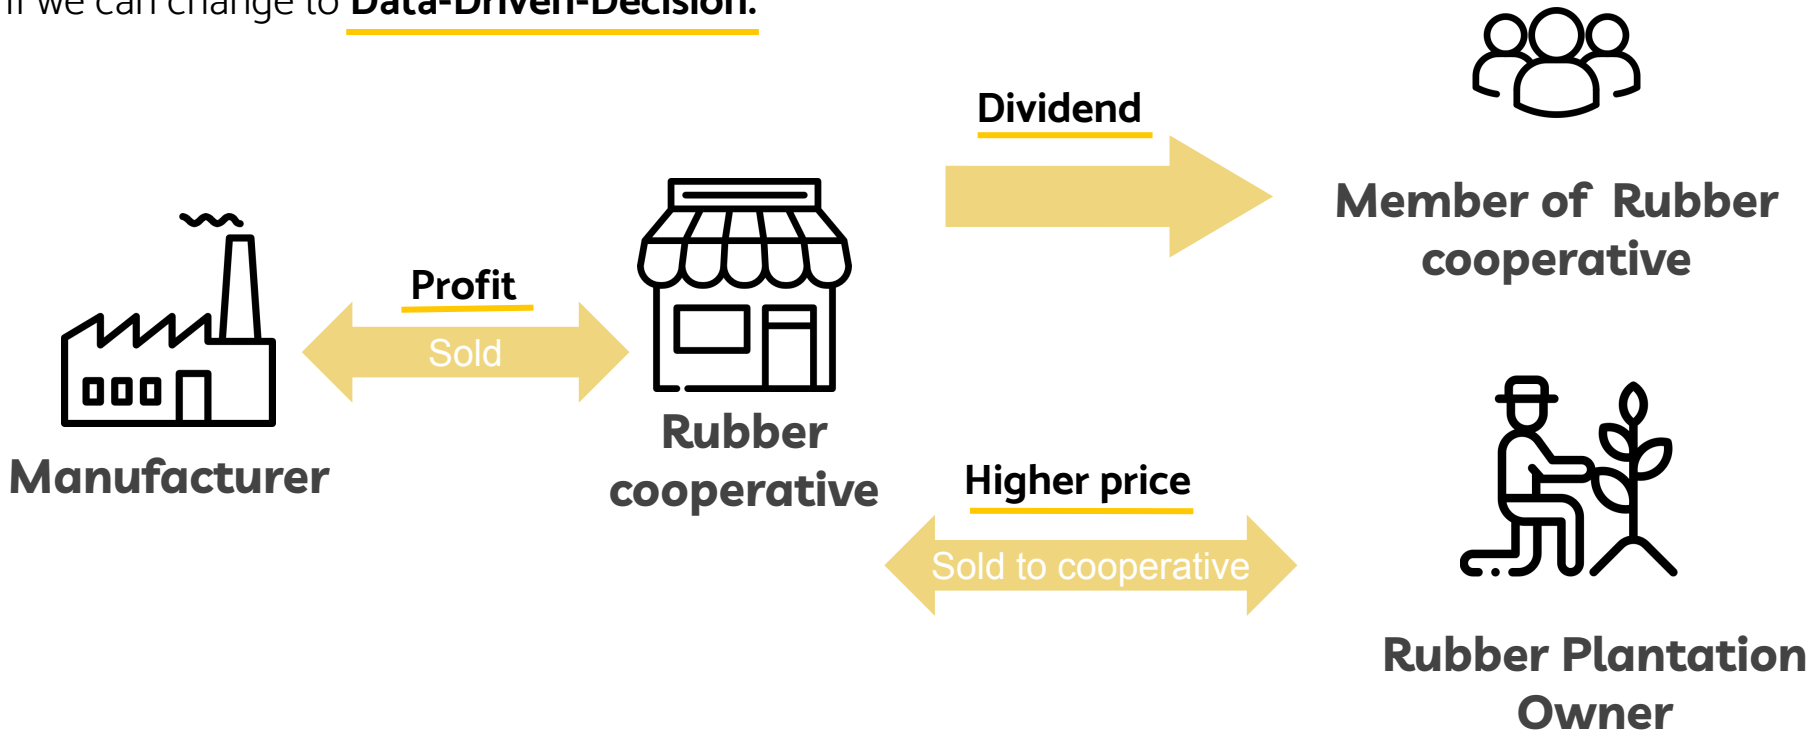

Problem Statement

“Rubber cooperative wants a model that forecasts **Ribbed smoked sheet** prices to estimate trend 1 month out to increase chance of success speculating in the Ribbed smoked sheet market”

Rubber Cooperative Cycle

If we can change to Data-Driven-Decision.

Direct Variables

Latex

Rubber Sheet

Cup lump

Ribbed Smoked Sheet

Tocom

FOB

Sicom

Indirect Variables

Currency **Appreciation** & **Depreciation** also impact the Rubber price because they are related to imports and exports

Singaporean Dollar

Yen

U.S. Dollar

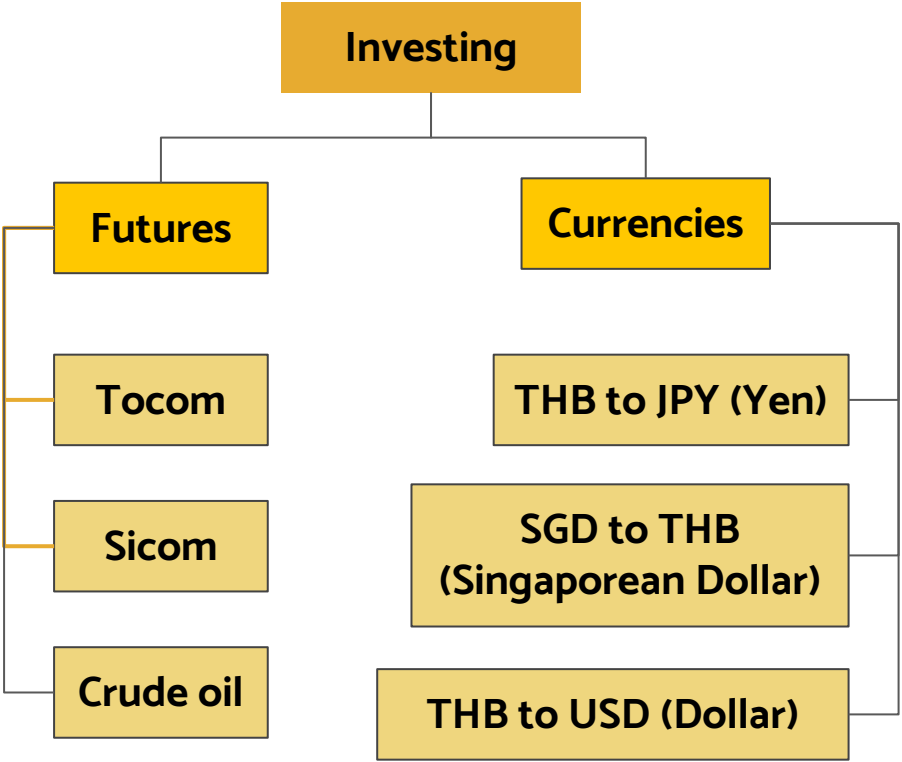

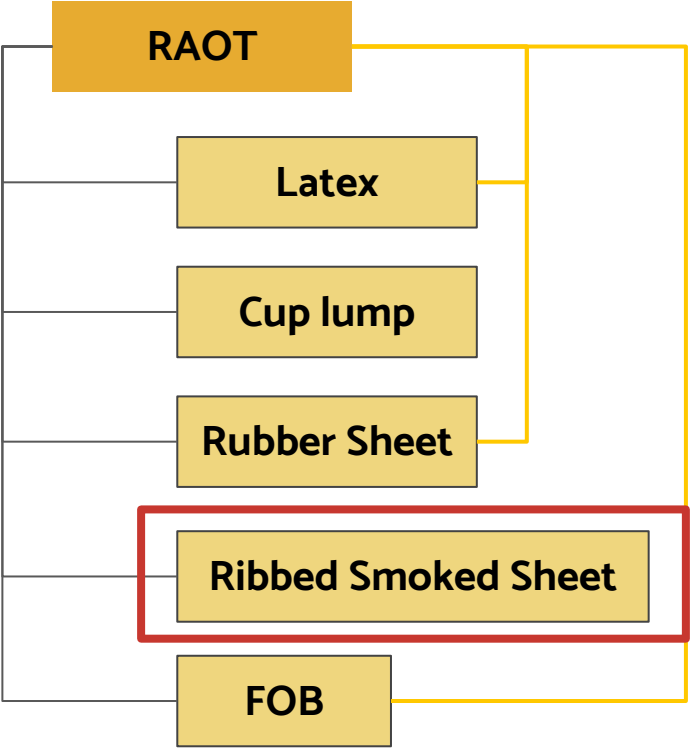

Crude oil can make Synthetic Rubber

Data Gathering

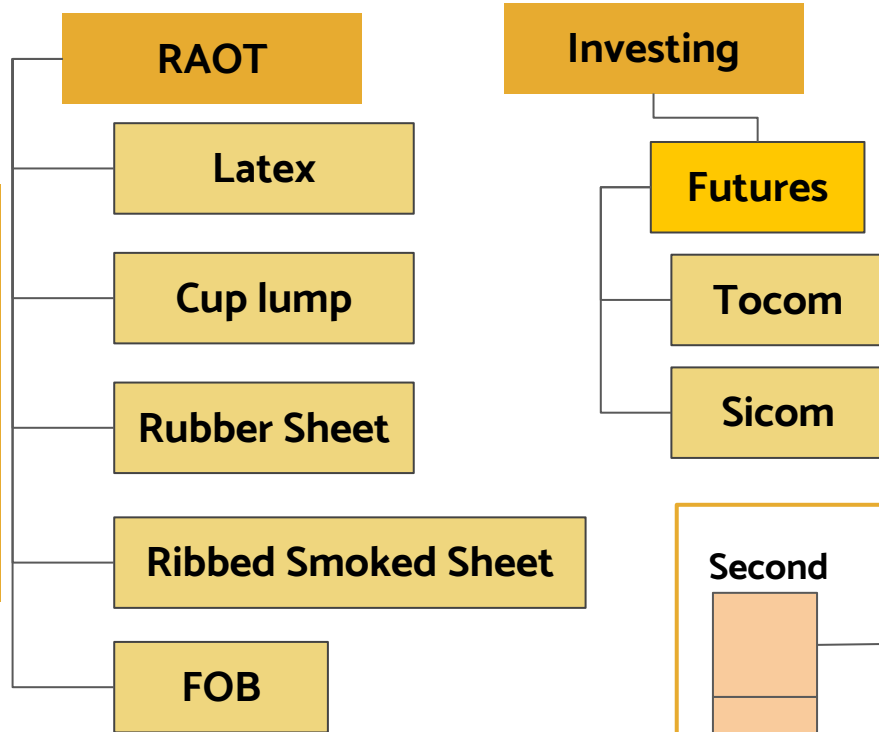

Year ranges
in data

2017-2022

2010-2022

Data Cleaning - Missing Values

Fill missing values with last observed value because it is a holiday.

Second Main

Main Data in year 2017 and 2018 half year of Latex are **missing**. Fill missing values from my second data which have data from year 2010 to 2022 and all of data nearly matches.

Part 2: 

Exploratory Data Analysis

RSS and Other Rubber Type Prices

Ribbed Smoked Sheet and other rubber prices 2017 - 2022 with moving average 1 month

RSS and Futures Prices

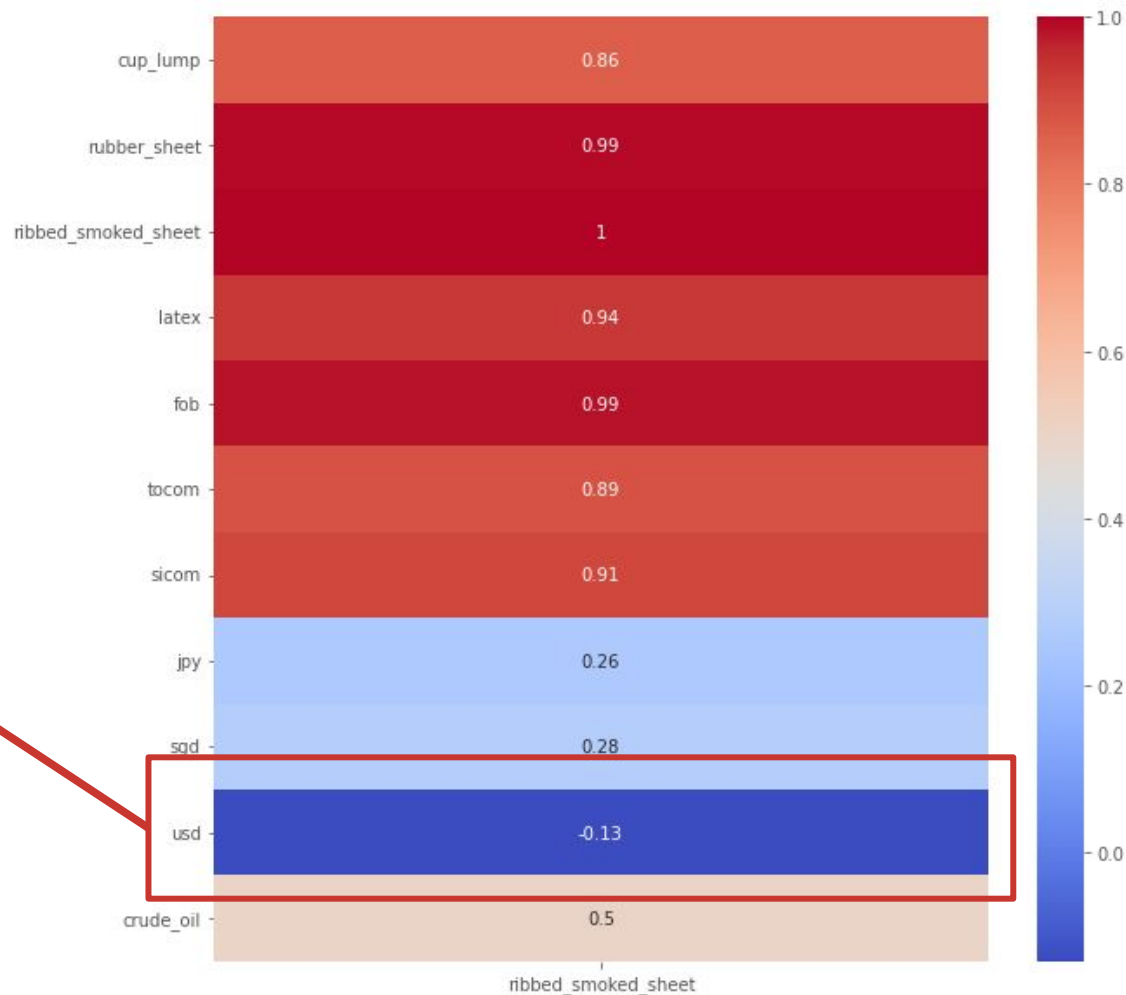

Ribbed Smoked Sheet and Tocom Prices 2017 - 2022 with moving average 1 month

Feature Selection

My criteria is features have correlation more than or equal to moderate correlation.

Delete usd variable because correlation does not meet my threshold of moderate correlation.

Part 3: Modeling & Evaluation

Goal for Developing Model

“Build model to forecast Ribbed smoked sheet prices 1 month out to estimate trend of RSS prices for Rubber cooperative. Model performance will be evaluated by MAPE. Model will be considered for production if MAPE score is better than baseline by 5% or more.”

^{**}It is a convention that we use MAPE for measure of prediction accuracy of a forecasting method^{**}

Baseline Model

RSS price prediction using ARIMA(1, 1, 1)

MAPE is 13.77%

RMSE is 7.29

MAPE is 13.77%

All models will be **compared** with the score above. If a model's **MAPE** score is lower than baseline score by 5 points or more, it will **pass**.

Models with features

RMSE is 0.79

RSS price prediction with currencies using AutoARIMA

MAPE is 13.32%

RMSE is 7.09

RSS price prediction with futures price using AutoARIMA

MAPE is 13.43%

RMSE is 7.12

All models with different method came up with **flat line.**

FAIL

RSS price prediction with Crude oil using AutoARIMA

MAPE is 13.32%

RMSE is 7.09

Model with all features

This model is fed **all features**, and predicted values have downward trend that fails to capture the pattern of the data.

RSS price prediction with all features using AutoARIMA
MAPE is 9.43%
RMSE is 5.38

Feature Engineer - Date

Found months 3 - 6 have average price **more** than other month.

Features Engineer

Quarter

Month

Modeling

The model perform better in capture trends but still make a lot of mistake and if looking carefully in **October** that model went too much **wrong**.

**Move up to more complexity model

Features engineer - Adding Indicators

Technical Indicator

EMA

tells the model whether there is an **up or down trend** in the data..

RSI

tells the price **momentum** to the model.

**Gave all data to predict october

Final model

Criteria for pass | 13.78% - model score \leq 5% |

Model perform a lot better in catching trend, but still have too many **errors** and the **score doesn't meet** criteria.

Part 4: 

Conclusion & Recommendation

Conclusion

“Build model to forecast Ribbed smoked sheet prices next 1 month to estimate trend of RSS prices for Rubber cooperative. Model performance will evaluate by MAPE, Will working in production part if **score better than baseline 5%**”

To conclude, this project **fails** because the data has complex trend and confounding variables. Final model captures wrong trend though it improved with more feature engineering. This project can be improved further if I can find **additional features and add more Indicators.**

Recommendation

1. RAOT has high quantities of rubber stock in warehouses which if brought to market could decrease RSS price in Thailand and globally. Thus, what needs to be included is **RAOT rubber stock quantity** as it might help model perform more accurately. ([source](#))

2. Find the **appropriate Indicators** to help forecast rubber prices, as in the final model, the indicators helped to model data trends.

THANK YOU

- My **Father** and **Mother** who always give me the important information.
- **James**, **Nozomi**, and **Mood**, my instructional team. They gave me guidance in this capstone project.
- My **classmates** for giving great ideas.
- **Everyone** in this room for paying attention to my presentation.

**Does anyone have
any questions?**

Additional

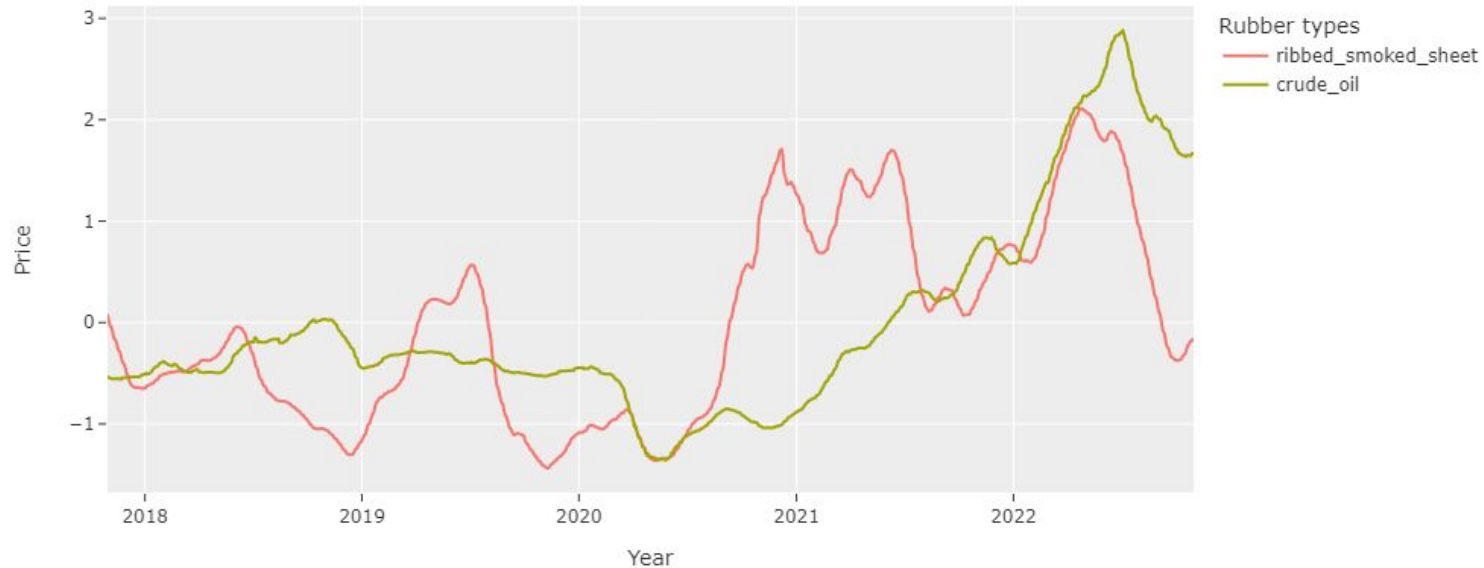

RSS and Currencies Prices

Ribbed Smoked Sheet and all currencies Prices 2017 - 2022 with moving average 1 month

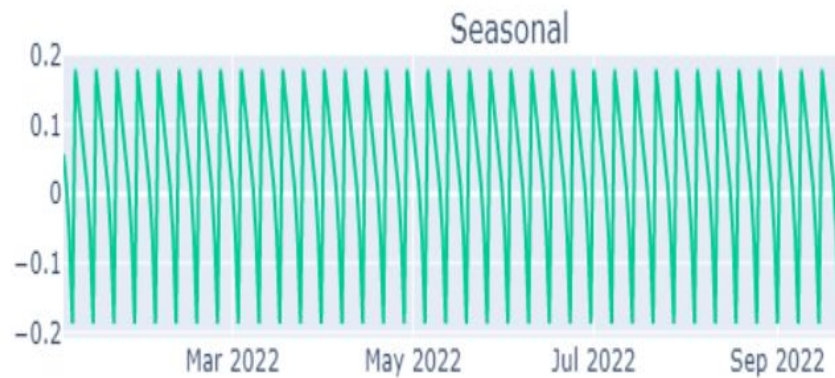

RSS and Crude oil Prices

Ribbed Smoked Sheet and Crude oil Prices 2017 - 2022 with moving average 1 month

Seasonal Decompose

There is no sign of seasonality of RSS price.

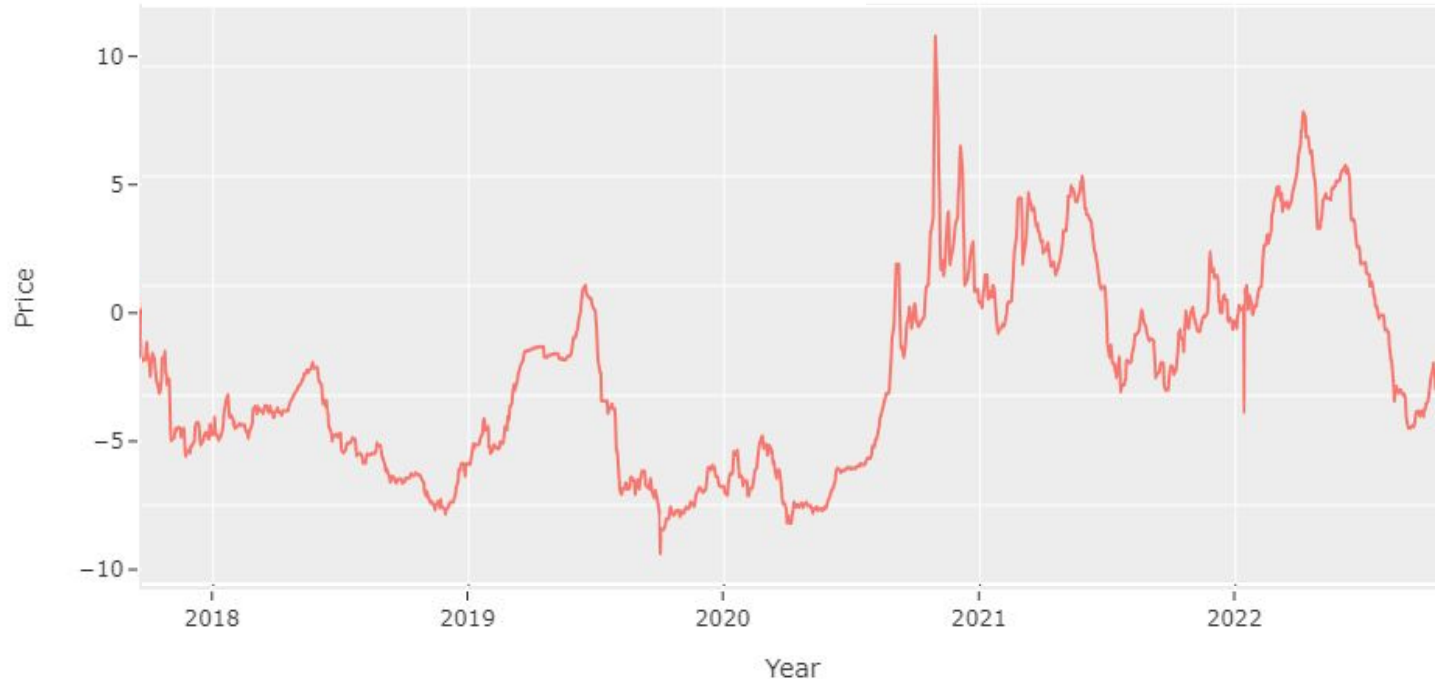

Ribbed Smoked Sheet Autocorrelation (ACF)

Stationary Test

Used **Augmented Dickey-Fuller** test for check **stationary** if P-value < 0.05 that dataset are stationary.

Ribbed Smoked Sheet Prices 2017 - 2022

RSS prices after differencing one time

P-value

0.00...

Baseline model only october

RSS price prediction using ARIMA(1, 1, 1)

MAPE is 3.72%

RMSE is 2.29
